Submit clean claims the first time and reduce the number of denied claims that require work on the back end.

Did you know that in addition to functioning as a full featured AR package, the **Seacoast SurroundLab AR** system may be installed as a front end Claim Scrubbing application? Whether you need a complete AR system or only a front end edits management solution, Seacoast has it covered!

With the **SurroundLab AR** comprehensive library of **Edit Filters,** you can be confident that incomplete claims will be held for review before submission for payment. Real time and batch **Eligibility Checking** is integrated in the module, allowing you to determine if a patient has provided current insurance information.

Our integrated **Scanning Solution** keeps your workflow organized and prevents the need for tracking and handling paper requisitions. Our scanned image work queue reports help you identify missing scans against received Accessions in Order Entry and vice versa, so no billable Accession is ever lost.

Easily manage Edits with our integrated **Edit Work Queue** module. Selection criteria for working Edits include Payer, Edit Type, Date of Service, Client and Location. Easy screen navigation allows you to move from the queue list to Order Entry and back again with ease.

And our comprehensive **Client Portal** provides on-line access for your Clients to review and complete their missing information requests. Data entered via the portal is immediately reflected in SurroundLab AR; once all edits are resolved, the claim is submitted to the payer without further user intervention.
